# Improper Input Validation Vulnerability in OWASP JUICE SHOP
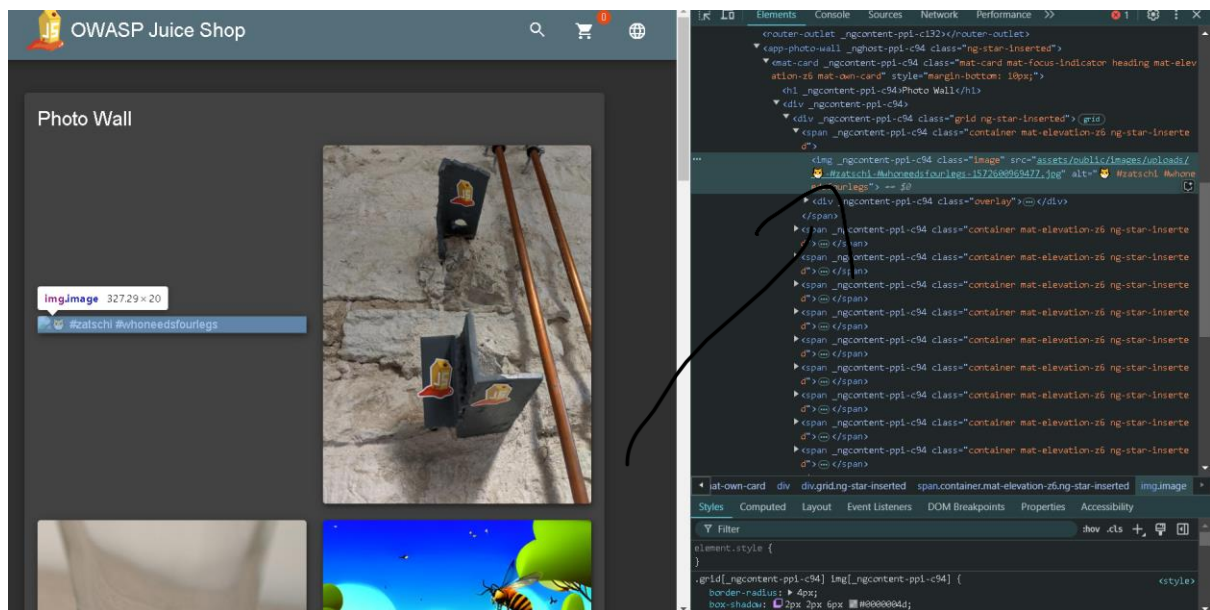

Missing Encoding

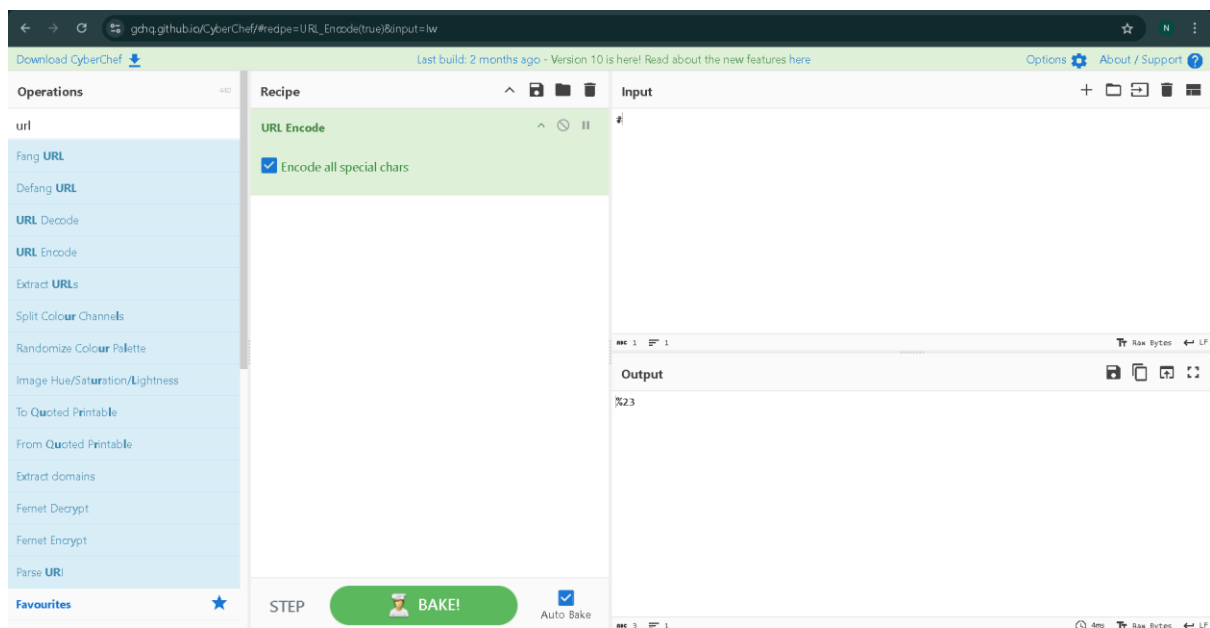

Here in the Photo Wall, we can see that one image is not being generated

If we go to the inspect page, we can see that in the image path there are "#" which doesn't work

We can encode the special character "#" using CyberChef,

By putting # in the input and URL encode as the operation we got %23 as the output

Now when we replace the "#" with "%23", we will get the image.
